

Analyzing and Optimizing Denitrification Hot Spots in Minnesota's Surface Waters

Abigail Tomasek, Jessica Kozarek, Miki
Hondzo, Michael Sadowsky, Jacques Finlay

From: pca.state.mn.us

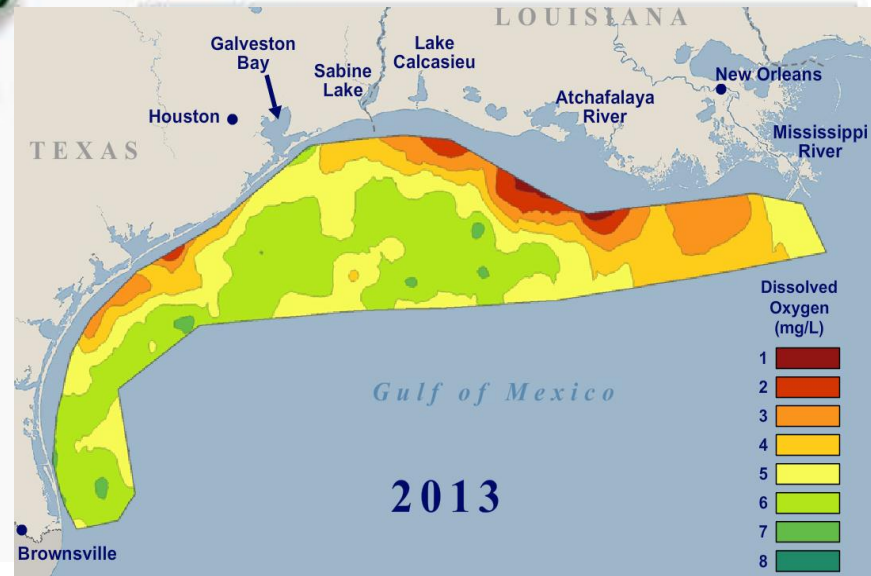

Nitrogen in Minnesota

Nitrate concentrations
www.pca.state.mn.us

- Large amounts of nitrogen fertilizer applied to agricultural land in Southern MN
- More than 70% of nitrate in MN is coming from cropland
- MN is one of the largest exporters of nitrate to the Mississippi River
- High nitrate loads in the Mississippi River is a leading cause of the hypoxic dead zone in the Gulf of Mexico

Highest Risk Of

Microbial Denitrification

Complete denitrification acts as a nitrate sink in aquatic systems, releasing N_2 to the atmosphere

www.nature.com

Denitrification Hot Spots and Hot Moments

Patches/intervals of **increased denitrification rates** relative to surrounding regions/time periods

Eagle Creek, MN

Hot spot formation formed by the convergence of ideal:

- Nitrate
- Organic carbon
- Anoxic sediments
- Fluid-flow residence time
- Established bacterial community

Overall Project Goals

- Identify and quantify the predominate parameters that control microbial denitrification
- Determine how these parameters affect the microbiological community and lead to denitrification hot spots
- Establish a set of management guidelines to promote denitrification hot spots

Denitrifying Gene Abundance

- DNA extraction and qPCR to quantify the amount of denitrifying genes in soil samples

To Mississippi R.

Outdoor StreamLab

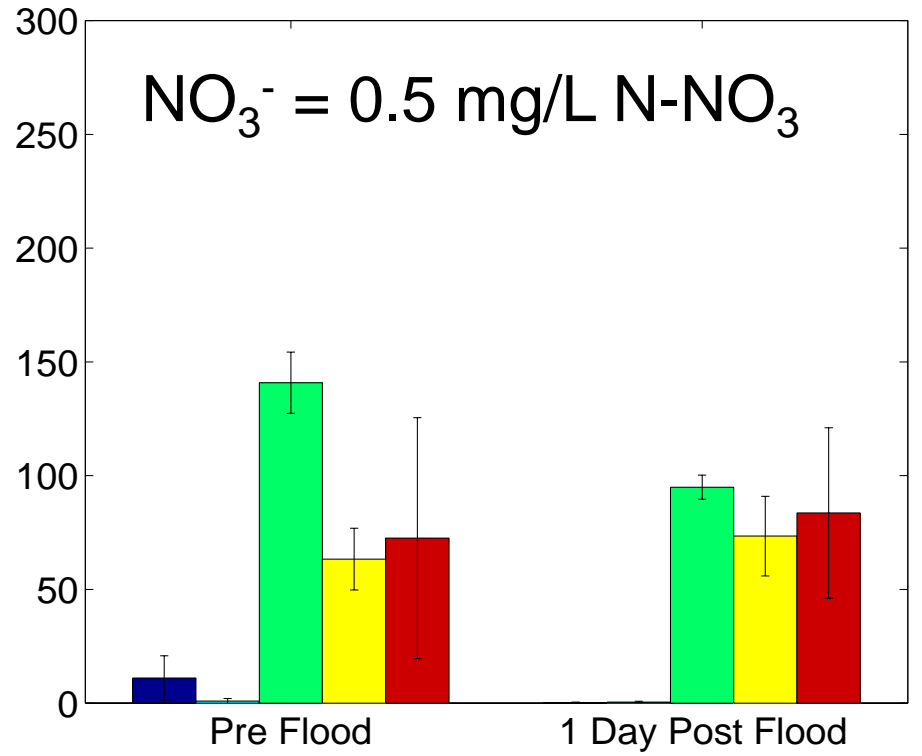

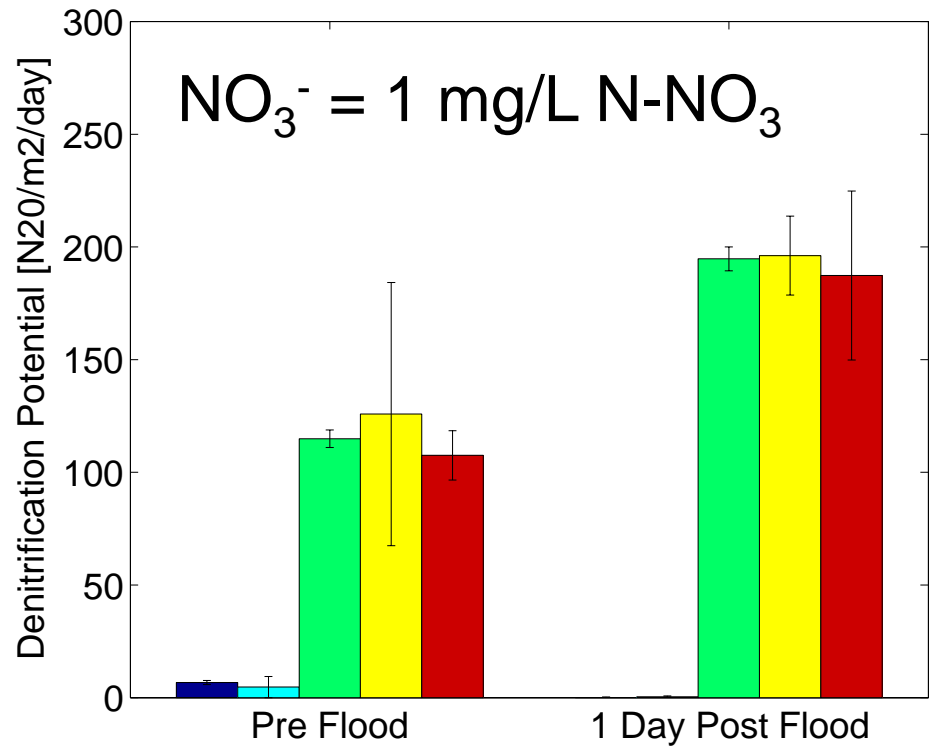

Outdoor StreamLab Experiments

- Entire floodplain of OSL was flooded twice
- Samples taken immediately before flooding, immediately after, 1 day after and 3 days after

OSL Floods

Bringing it all Together: Dimensional Analysis

	Bulk Density (ρ_b)	Organic Matter (BOM)	Moisture Content (MC)	Shear Velocity (u_*)	Nitrate Concentration (C_{NO_3})
Potential Denitrification (J_{NO_3})	-	+	+	-	+

$$\left[\frac{J_{NO_3}}{u_* C_{NO_3}} \right] = 10^{3.25} \left[\left[\frac{u_* H}{\nu} \right]^{-1.27} \left[\frac{BOM}{MC} \right]^{4.99} \left[\frac{\rho_b}{C_{NO_3}} \right]^{0.79} \right]^{0.58}$$

Overall Relationship

Potential Denitrification - Flume

Future Work

- Microbial work
- Laboratory flume experiments
- More field data collection
- Additional OSL flood experiments
- Small-scale basin studies in OSL
